The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., In re Berg, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); In re Goodman, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); In re Longi, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); In re Van Ornum, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); In re Vogel, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and In re Thorington, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 19-25 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-7, respectively, of U.S. Patent No. 6,387,562 in view of Kuroda *et al.* (US 5,354,629). Patented claim 1 is identical to present claim 19, except for the recitation that "an end of at least one of the electrode terminal leads is positioned at a distance inward from a lengthwise end of a respective current collector". Kuroda *et al.* disclose a cell that, like the patented cell, is a wound assembly of an anode and a cathode (column 2, lines 7-12). The anode terminal tab is attached to the anode at a position away from the end thereof (column 2, lines 15-20). The cathode (4) also has its terminal tab (6) positioned away from its end (figure 2). This arrangement prevents short circuits when power is overdrawn from the cell (column 4, lines 18-23). For this reason, it would be obvious to position the electrode terminal

Art Unit: 1745

leads of patented claim 1 away from the ends of the respective electrodes, as shown by Kuroda *et al.* Present claims 20-25 add the same respective details as patented claims 2-7.

Applicant's remarks concerning the restriction required in the parent case have been noted. That restriction was made between the present article claims and the method claims also present in the parent case. This double patenting rejection is made, not over method claims, but over another set of article claims, which have not been restricted from the parent claims.

The disclosure is objected to because of the following informalities: The specification, for example on page 9, line 13, refers to positive and negative "terminals". However, the two parts thus identified appear to be electrodes, and not "terminals" as this term is normally understood. Appropriate correction is required.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Akahira (US 6,706,080) is the patent issuing from the immediate parent application. Takeuchi *et al.* (US 6,136,466) and Howard *et al.* (US 5,439,760) disclose spirally wound cells with terminal tabs connected to their electrodes.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Stephen J. Kalafut whose telephone number is 571-272-1286. The examiner can normally be reached on Mon-Fri 8:00 am-4:30 pm.

Application/Control Number: 10/780,532
